POWER, AIR, AND WATER

Building systems—specifically power, air, and water—make skyscrapers possible. These systems are the lifeblood of a building, providing power to the lights and equipment, air to the people, and water to the people and the building itself. They are the veins and arteries of a skyscraper, and without them, the building would be nothing more than a shell.

Building Systems

The systems that make a skyscraper work are complex and interconnected. They include power systems, which provide electricity to the building's lights, equipment, and people; air systems, which provide fresh air to the building's occupants; and water systems, which provide water to the building's occupants and equipment.

AN OFFICE BUILDING

An office building is a type of skyscraper that is designed to house office spaces. It typically has multiple floors, each with its own office spaces, and is designed to be energy efficient and comfortable for its occupants.
