Editorial Review

Review

"The study of anatomy is often a challenging endeavour for many medical students. Central to the learning process is the use of a good textbook. Two of the most often recommended texts for medical students are **Gray's Anatomy for Students (GAS)**, descended from the iconic text by Henry Gray, and **Clinically Oriented Anatomy (COA)**, by Moore, Dalley and Agur.

"Both texts employ a regional approach to the study of anatomy. **GAS** separates each chapter into four sections: *Conceptual Overview*, *Regional Anatomy*, *Surface Anatomy* and *Clinical Cases*. The conceptual overview aims to provide the very basic concepts of each region in a concise summary before moving on to an increasingly detailed description. While this approach may be useful for the beginner or reviewer, the inevitable repetition creates a degree of redundancy. **COA** presents information in a "bones up" format, progressively adding surrounding structures before detailing the arthrology of each region. Each chapter concludes with a series of radiographic images to complement integration and understanding.

"Certain striking distinctions are evident in the textual quality of each book. **GAS** aims to strip away irrelevant information into an easy-to-read summation while leaving intricate details for other texts. While this provides an excellent introduction for the neophyte, **COA** includes more rigorous explanations concerning the finer points and the complex interaction with surrounding structures. An enlightening example of the differing styles can be observed through the treatment attributed to the sternocleidomastoid (SCM) muscle. A concise, tabular description of muscular attachments, innervations and basic function is provided in **GAS** in association with a stylised diagram indicating its position in the neck. Conversely, **COA** devotes an entire four page sub-section to a detailed discussion of the manner in which body position and the use of synergist muscle groups can alter function of the SCM beyond an isolated view of the muscle acting independently in the anatomical position. Thus, while simplified to enhance the initial integration of basic concepts, **GAS** may simultaneously perpetuate certain erroneous notions concerning the nature of anatomical function. On the other hand, the text in **COA** may reduce its effectiveness for the uninitiated, while **GAS** may prove to be too simplistic for the interested student.

"Both books approach diagrammatical representation through the use of computer-generated imagery, though distinct dissimilarities are visible. **COA** depicts each region by incorporating detailed and realistic diagrams which are thoroughly labelled. In contrast, **GAS** represents analogous images through a distinctly stylised fashion. Major structures are portrayed in an idealistic mode, which, in combination with relatively sparse labelling, may impede practical application, particularly in medical courses focussed on anatomical dissections. However the simplified overview, devoid of extensive detail, is potentially easier to comprehend for the less experienced anatomist. In addition to detailed, accurate labels, **COA** consolidates diagrammatic elements through representations in various anatomical planes. The depiction of distinct layers within each system aids the appreciation of the detailed nature of such structures. Ultimately, **COA** associates these illustrative characteristics through the use of numerous, detailed figures within each specified anatomical region. The use of **COA** may prove to be beneficial, both in dissection and in providing a broader scope of understanding.

"The integration of clinical aspects throughout a text is essential to the effective understanding of anatomical information. Both books appear to have achieved a relatively streamlined integration of such information

through the utilisation of clinical vignettes. Complemented with relevant diagrams, topics covered in the text of these vignettes include information relating to development, anatomical variation, radiology and pathology. For those without significant exposure to anatomy, having clinical information presented in such a fashion is an ideal mode for the consolidation of vital concepts. The use of end of chapter case studies in **GAS** allows the reader to evaluate their own level of understanding, a feature that is absent in **COA**. Radiological correlations in **GAS** are discussed further through an in-text approach. Alternatively, **COA** utilises radiological imaging juxtaposed with easily understood computer generated diagrams, allowing the student to understand the concepts therein with more clarity.

"Through our experience in both learning and teaching, we believe that **COA** delivers a more comprehensive insight into the study of anatomy. Not only does it encompass a strong clinical foundation, it provides the reader with enhanced factual information and diagrams. Contrastingly, **GAS** offers equivalent aspects in a more concise, readable form yet neglects more in-depth explanations. The choice of textbook will ultimately depend on both the school curriculum and the eagerness of individual students. Whilst providing an excellent synopsis into the anatomical world, the possibility exists that students may find **GAS** lacking after covering the basic concepts. It is our view that **COA** offers greater scope for continued learning throughout medical school and beyond."—**Australian Medical Student Journal**
